## Theorem 3.1

If a labeled walk positively folds at step  $k$  across a hyperplane of type  $H_{\pm\alpha_i+j\delta}$ , then the folded walk is obtained from  $w$  by introducing a folded step at step  $k$  and reflecting the tail across  $H_{\pm\alpha_i+j\delta}$ .

## Theorem 3.1

If a labeled walk positively folds at step  $k$  across a hyperplane of type  $H_{\pm\alpha_i+j\delta}$ , then the folded walk is obtained from  $w$  by introducing a folded step at step  $k$  and reflecting the tail across  $H_{\pm\alpha_i+j\delta}$ .

This makes it very easy to compute folded walks!

What is  $w'$ ?

$$w' = s_1 s_1 s_2 s_0 s_1 = s_2 s_0 s_1.$$

Replacing a walk with a fold means we **don't** cross a hyperplane at that step so we need to remove the reflection we applied:

$$s_i^2 = 1.$$

Idea: We can only positively fold across a hyperplane  $H_{\pm\alpha_i + j\delta}$  if  $-\alpha_i \in S_w$ .

Careful,  $S_w$  changes after we fold! It does so in a way that decreases the total amount of  $-$  shapes in  $S_w$ .
